Project Title: Image Captioning AI

Objective: My project automatically generates a sentence describing an uploaded image.

Technologies Used: Python, Google Colab, PyTorch, Hugging Face Transformers, and the BLIP pretrained model.

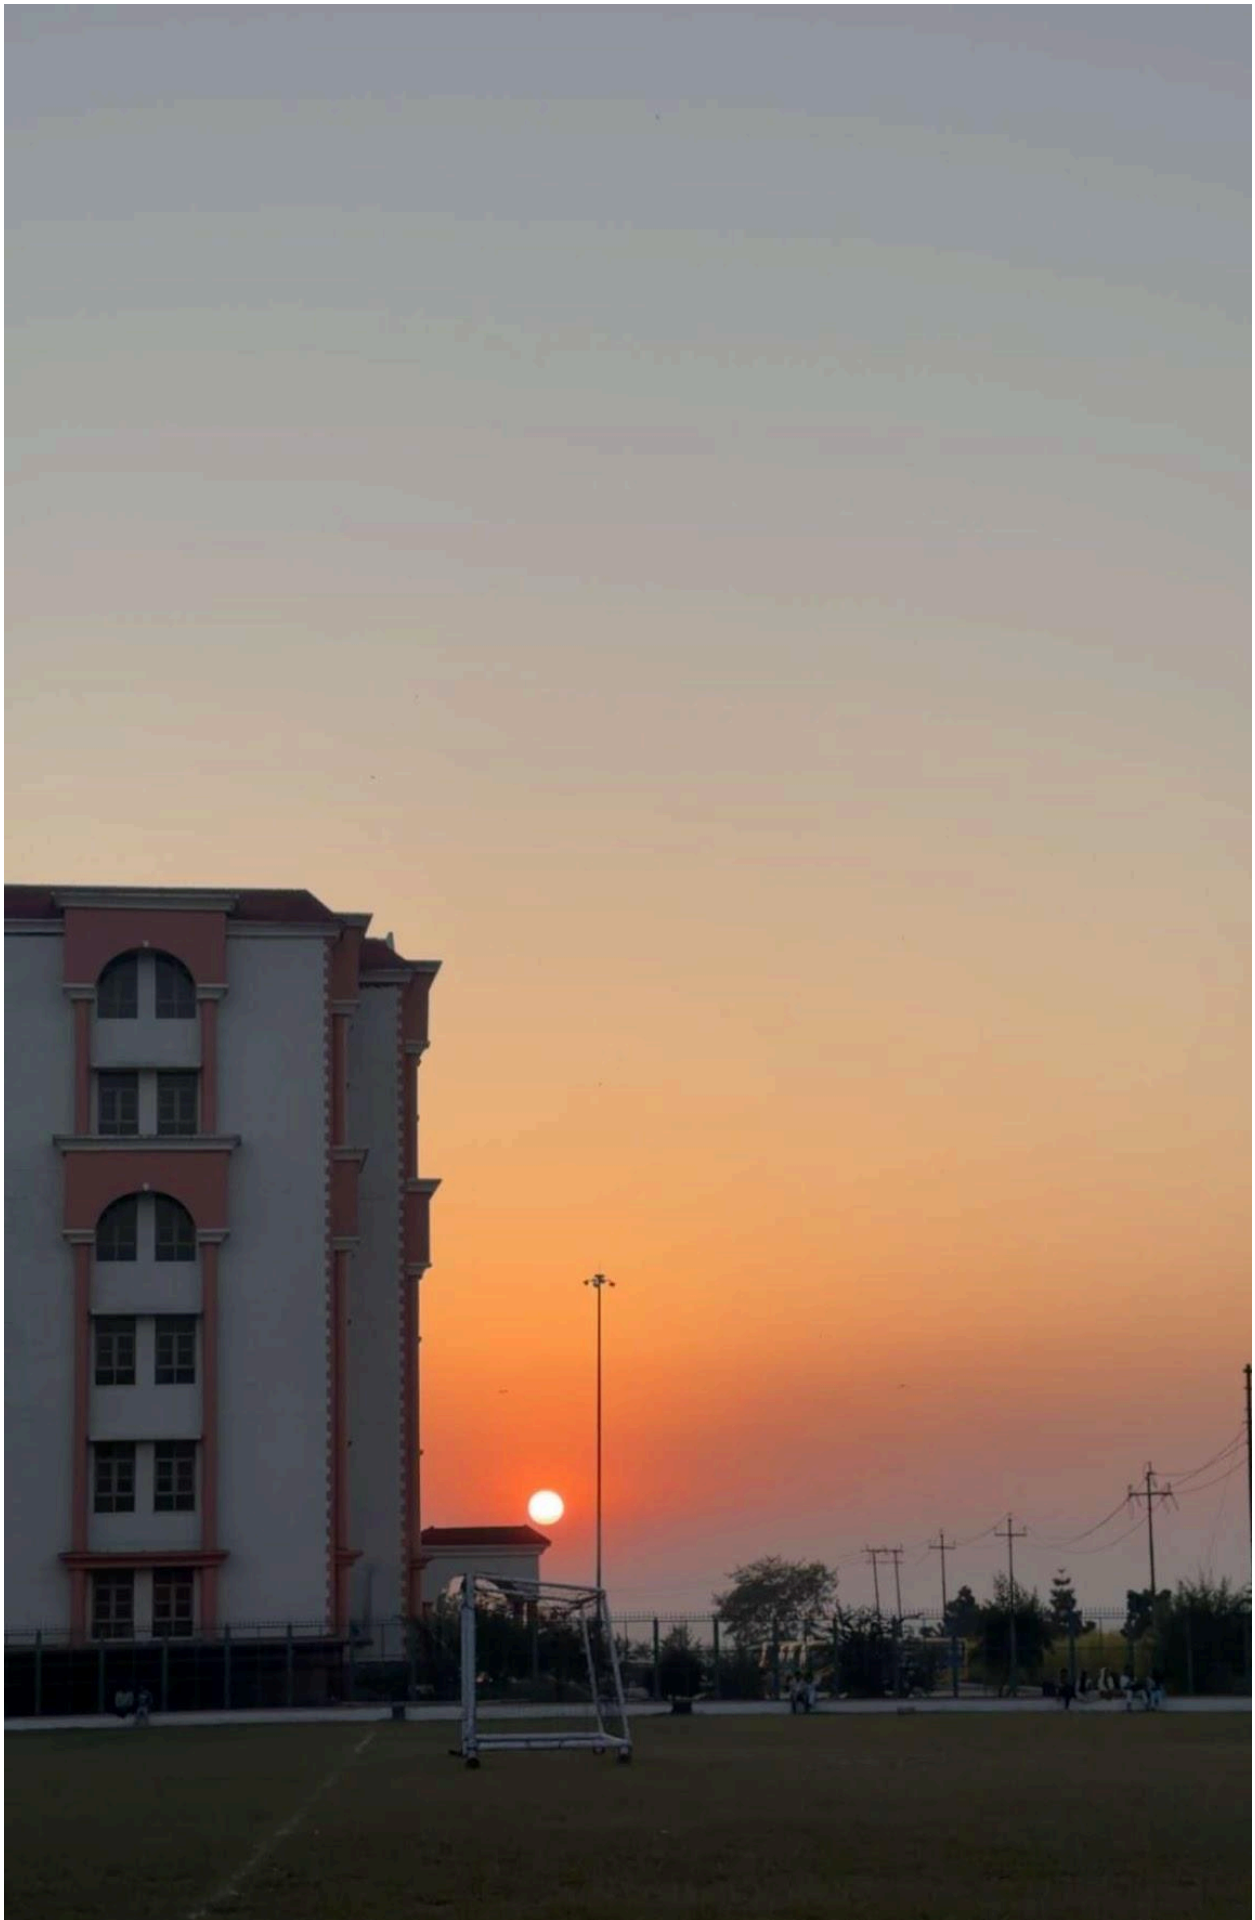

Working Process:

1. The user uploads an image.
2. The AI model analyzes the image.
3. The model generates a caption describing the image.
4. The generated caption is displayed as output.

Example:
Input: A photograph of a dog running in a park.

Output: “A dog is running through a grassy field.”

Conclusion: This project combines computer vision and natural language processing to generate captions for images using a pretrained AI model.
